

HBA of Metro Orlando Green Building Committee presents

March 14, 2008

11:30a-12:30p Networking/Lunch
12:30p Program

An Introduction to the NAHB National Green Building Program

Dr. Carlos Martin
Assistant Vice President for
Construction Codes and Standards
National Association of Home Builders

Members: \$24.99
Future Members: \$40.99

HBA of Metro Orlando
544 Mayo Avenue
Maitland, FL 32751
407.629.9242

Speaker Credentials:

- Experienced in the academic, governmental, and private sectors in the areas of technological and social change related to the design and construction industry.
- Trained as an architect, construction engineer and historian of technology, Dr. Martin studies the cultural and industrial barriers to change- especially those related to housing production and regulation.
- Monitors both regulatory changes in homebuilding construction as well as the new NAHB National Green Building Program.
- Served as the SRP Assistant Professor for Energy and Environment at Arizona State University's Del E. Webb School of Construction and School of Architecture, a coordinator for the US Department of Housing and Urban Development's Partnership for Advancing Technology in Housing (PATH), and more recently Technical Director for Housing with the Development Innovations Group, where he worked on an international survey of housing for a major US philanthropic organization.

Event Objective:

- This presentation will cover how builders can comply with the Standard and will also provide an overview of the NAHB National Green Building Program, which builds off that foundation with an online scoring tool, educational resources, protocols for verification and certification that homes meet the criteria and, for consumers, a national database of builders and certified homes.
- New voluntary residential National Green Building Standard for sustainable home building, land development and remodeling that is being published by the International Code Council and the NAHB-which is likely to transform the residential marketplace in the years to come.
- The National Green Standard defines what makes a home green, like energy, water and resource efficiency. It also defines practices that should be incorporated into the construction process to reduce waste, preserve trees and use locally sourced materials, and to ensure that homeowners understand the proper operation and maintenance of their green home.
